STS Verzeichnis STS 0193

Content.

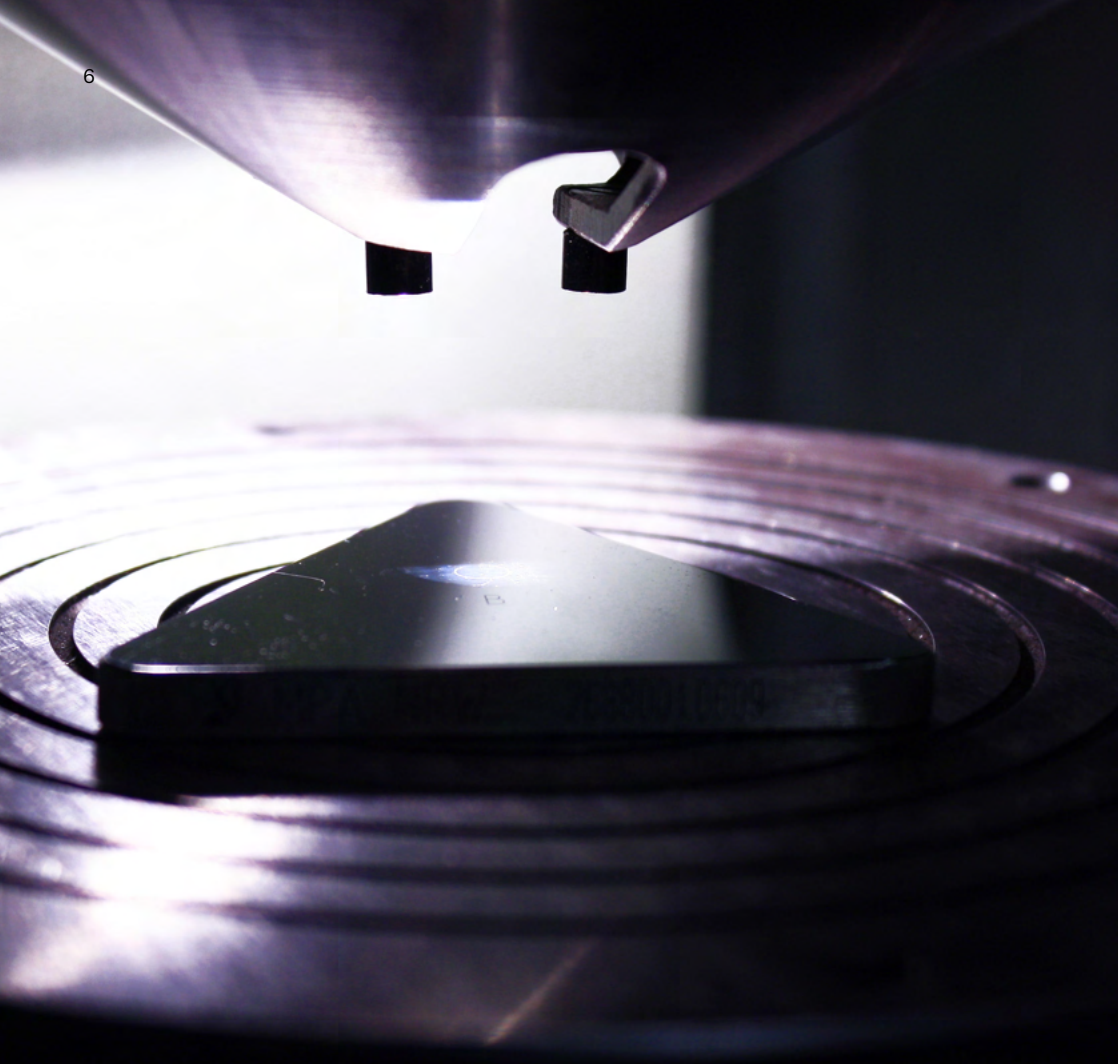
Over four decades of experience.

Beyond Gravity has been involved in space missions since the first space missions in the early 1970s. For us, reliability, meticulous planning and, not least, rigorous testing are important and vital parts in the development of components, electronics and structures for use in space. With our long-standing experience and extensive knowledge we are able to test a wide range of materials and products in our test facilities in Switzerland, Sweden, Germany, Austria, Finland and the US. The testing for qualification and testing of flight hardware and industrial products is one of our core competences. This includes destructive as well as non-destructive testing.

Wide range of testing services for aerospace and industrial applications
Beyond Gravity offers extensive problem solving including, if necessary, model simulation, suggestions for improvement as well as crosschecking of the measures taken. Many methods and various types of equipment are available for non-destructive testing of materials, components and electronics: measurement of hardness, x-ray florescence, electrical conductivity, friction, optical microscopy, standard ultrasonic as well as phased array technique, an automatic air-coupled ultrasonic transmission test facility for large test articles, acoustic composite material testing as well as penetration tests using fluorescing class III fluids give us the possibility to not only characterize material under test, but also detect defects such as cracks, pores or delamination. Beyond Gravity has a long-standing history in the management and execution of mechanical and structural testing. The extensive experience and expertise gained over many years of testing internal projects, combined with the specialized testing equipment developed during this time, ensures that a reliable partner is also available to external customers for all testing services.

The Beyond Gravity Test Centers are also able to perform environmental simulation testing, utilizing a variety of shakers, climatic chambers and thermal vacuum chambers as well as a centrifuge in order to test components and electronics under temperature, humidity and pressure conditions as well as vibration arising for example during space missions or other types of harsh environments. Our test facility for testing of components, printed circuit boards and electronics can handle the most relevant types of tests for evaluation and investigation including X-ray, PIND testing, Seal test, thermal dissipation tests as well as tests to determine solder bonding and PCB quality.

Consultation included
Beyond Gravity does not only provide the testing services but also offers consulting services with regards to the selection of materials, machining processes and heat treatments for an optimization of the microstructure of components. With our skills, we also assist in the investigation of the root cause of damages and, thus, help to optimize future test procedures and manufacturing processes. All Tests will be performed according to well established standards such as DIN, ISO, MIL, EN, IEC, etc. However, Beyond Gravity has also the possibilities to test according to other standards after consultation. All our equipment is calibrated according to national and international standards.



Hardness test device / Härteprüfgerät

Material Testing & Non-Destructive Inspection.

The Beyond Gravity Materials Testing Laboratory is certified to conduct non-destructive testing of materials including composite structures. It is equipped to measure the physical properties of materials, including the capability of sample manufacturing and preparation. Proper sample management is crucial in producing accurate and reproducible results, and in complying with regulatory requirements. Our specialists offer a range of expertise, including X-ray analysis, microscopy, friction, and dye penetrant testing. These services are available to external customers as well as for our own projects.

Hardness
Equipped with multipurpose and micro hardness measurement devices from Leica and Gnehm, Beyond Gravity can determine the Vickers, Brinell as well as the Rockwell Hardness of materials.

The degree of hardness is often determined in addition to the tensile test, since the hardness value is proportional to the tensile strength.

With our portable test equipment, it's also possible to perform on-site measurements to determine hardness.

- Vickers Hardness
- Brinell Hardness
- Rockwell Hardness
- Shore Hardness
- Leeb Hardness
- Hardness Gradient in Materials

X-Ray Fluorescence
With our XRF Analyzers, Fisherscope and Delta X the alloy composition of a sample can be determined in a matter of seconds. This device uses X-rays and measures the fluorescent X-rays which are specific for each element. Almost all metals and other trace elements can be detected. We can perform this test in our facilities or on-site.

- Determination of Alloy Composition
- Detection of Trace Elements

Optical and Scanning Electron Microscopy
To investigate micro sectioned parts but also to investigate other samples more closely, optical microscopes, stereoscopes and Scanning Electron microscopes are available and can provide a resolution of 2nm and up to 2,4 million times magnification. Grain structures of etched metal surfaces can be made visible using polarized light, for which a range of polarizing filters is available. The microscopy is also used for many more purposes, such as fiber, volume content, micro-structures, pore content, coating thickness and detection of non-metallic inclusions in stainless steels.

- Microstructure
- Texture Gradient
- Fiber Volume Content
- Porosity Content
- Coating Thickness

XRF Analyzer / Röntgenfoureszenz-Analysator

Microscopy equipment / Mikroskopie-Ausrüstung

Electrical Conductivity (SIGMATEST)
With the SIGMATEST device it is also possible to determine the specific electrical conductivity of non-ferromagnetic electrical conductors. In combination with hardness measurements or XRF testing it is therefore possible to not only determine the alloy composition of a sample but also its condition.

- Conductivity measurement
- Determination of the heat treatment conditions of aluminum

Dye Penetrant Inspection (DPI)
Dye penetrant testing is one of the most commonly used NDT methods. This NDT technique is a cost-effective method used to locate surface cracks or other surface discontinuities.

The dye penetrant testing facility in Zurich is part of the Beyond Gravity Materials Testing Lab. Small-series or one-off production can be assessed flexibly and quickly in our stationary facility by our experts certified according to EN 4179 / NAS 410.

Ultrasonic and Acoustic Testing
For composites, it's really important that Carbon Fiber Reinforced Polymer (CFRP) panels don't have any layers separating in other words these panels are free of delamination. That's why we put a lot of work into checking them without causing any damage, using sound-based testing methods. In acoustic testing, the interference pattern of reflected sound waves provides information on the bonding properties of laminates and sandwich structures. Our mobile testing gear is very flexible and can be used on both large and small structures.

We use a bond tester to check parts for layer separation in the sound frequency range. Furthermore, automatic air-coupled ultrasonic transmission test facilities are used to test large sandwich-panels and carbon fiber tubes for failures and delaminations. The measurement data sampled during the test are recorded and converted into C-scan pictures for post processing.

- Our testing capabilities include:
- Finding layer separations
- Phased Array Ultrasonic Tests
- Linear Array Ultrasonic Tests
- Standard Ultrasonic Tests
- Image tube scanner

Ultrasonic NDI test on VEGA fairing

Test Fluid System for Penetration Testing

2D Automated NDI machine

NDI-Equipment

Mechanical Tests
Our universal mechanical testing machines are designed for versatility and can be used in accordance with ASTM, EN, and custom standards tailored to customer needs. We are capable of performing:

- Tensile and compression tests
- Interlaminar Shear Strength (ILSS) test
- 4-point bending test and more...

The tensile testing machines from Zwick, Shimadzu and Instron are the most often used ones for tensile and compression tests. Strain gauges and displacement transducers provide a tool for very exact displacement determination. Forces up to 250 kN can be applied.

Ovens mounted to the tensile testing machines enable testing between -160°C and 350°C. Specialized devices also allow for evaluation of bending and shear properties.

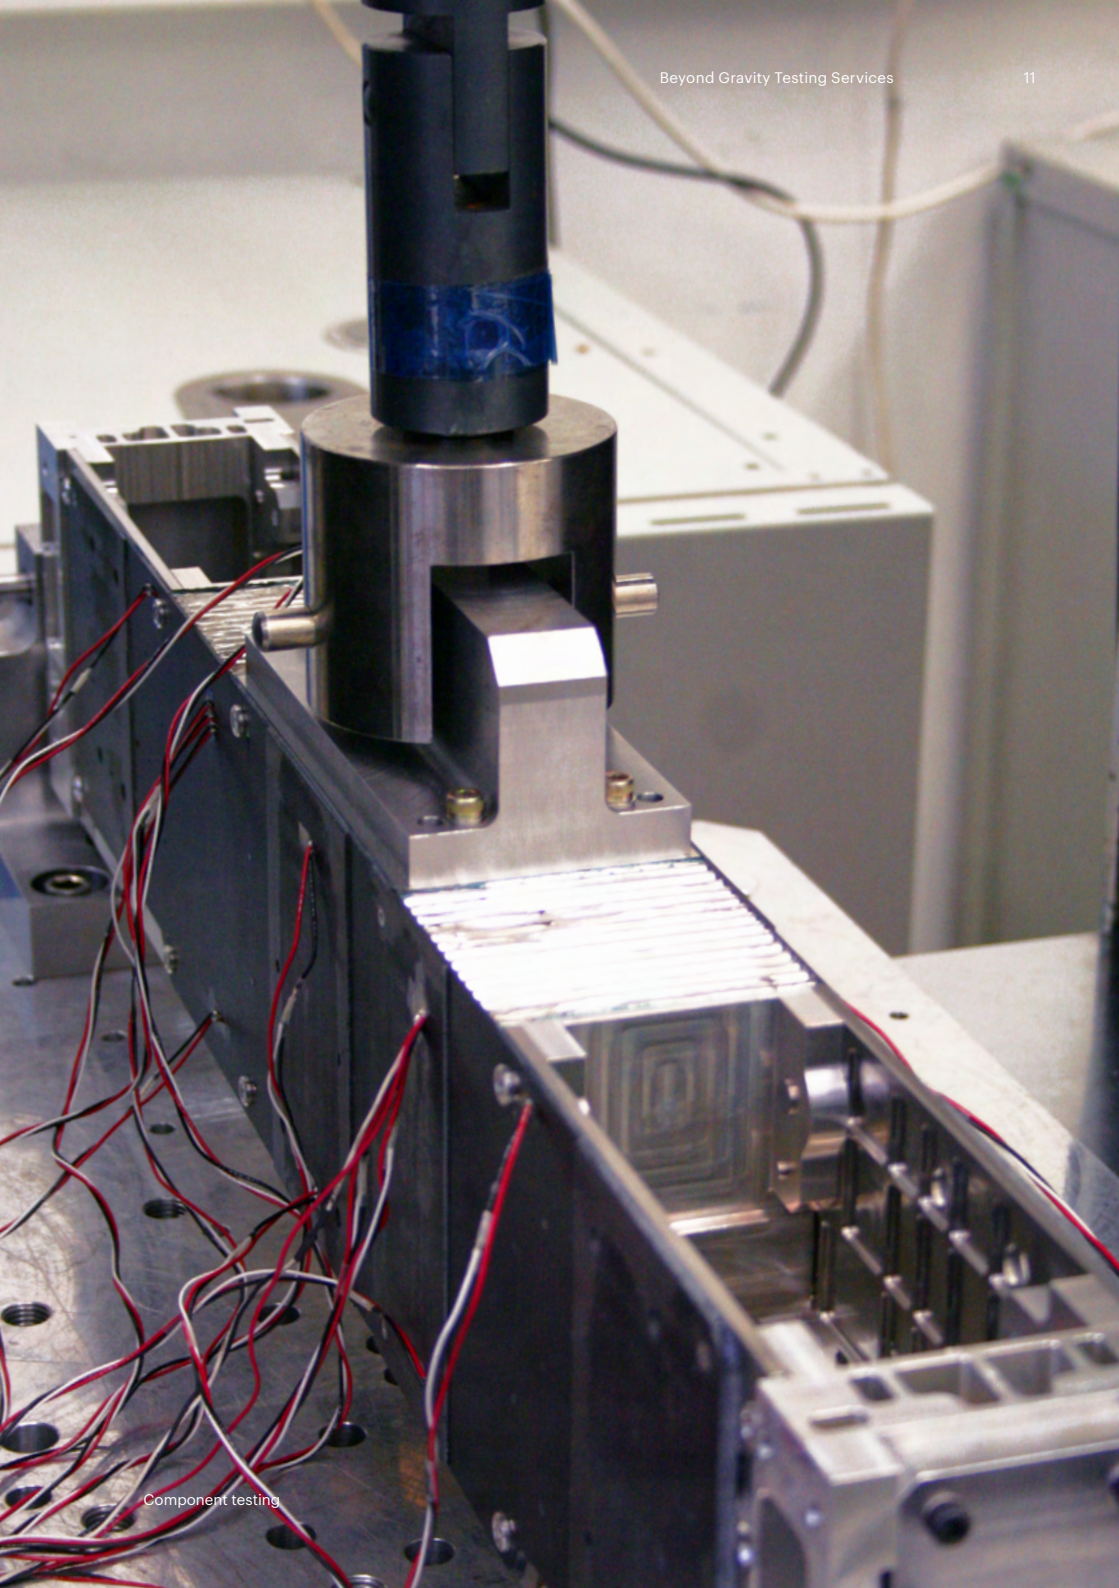
A broad variety of adapters enable testing of different geometries. In particular, the testing of components requires special equipment. The obtained properties

include but are not limited to stiffness under compression, spring constants, force-displacement diagrams, etc., to characterize brackets, hinges, fittings and similar components.

Measurable Properties for metallic and/or composite Materials:

- Young 's Modulus E
- Proof Stress Rp0.2
- Yield Strength ReH, ReL
- Tensile Strength Rm
- Elongation at break A
- Compressive Strength at Break RbB
- Flexural Strength B
- Shear Modulus G for composites

Model	Maximal Load	Electrical Strain Gauges	Temperature Range
Zwick 250	250 kN	6 Channels	from -160 °C to +350 °C
Instron 5985	250 kN	-	Ambient
Shimadzu AG-X plus	100 kN	8 Channels	from -70 °C to +280 °C
Shimadzu AG-X	20 kN	-	from +25 °C to +280 °C
Instron 5966	10 kN	-	Ambient
Instron SF1240	5 kN	-	Ambient



Component testing

Bolt testing

Friction testing

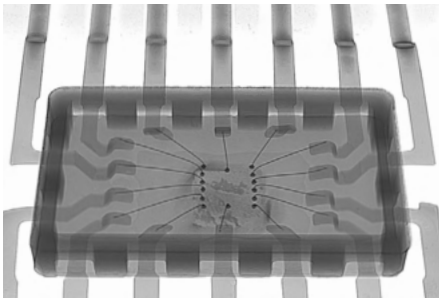
Bolt Testing
Our bolt testing equipment can test and evaluate thread torque, screw head torque and bolt tension.
Using our wide range of standard or bespoke adapters we can give truly representative conditions for the bolted joint all the way down to the correct surface treatment.

	Equipment	Maximum Load
Thread torque	M-2230	±100 Nm
Screw head torque	M-2230	±100 Nm
Bolt tension	M-2230	100 kN

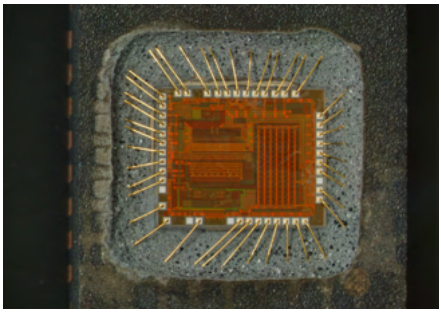
Friction Testing
With our friction test rig we can provide the resulting friction and wear when combining different surface treatments. Our test rig consists of a stiff frame with two hydraulic cylinders and load cells, one for each of the force to provide the normal pressure and the force for pushing the test sample. The coefficient of friction is calculated from the reading of both pressure forces.

Normal load: 100 kN
Shear load: 10 kN

Electronic Components
The Beyond Gravity Test Center has the equipment and the technical know-how when it comes to testing electrical components and PCBs. We are able to evaluate the performance, function and the quality of both surface mounted components as well as hole mounted components. We can determine and evaluate bonding properties of soldering and use X-Ray equipment to see the properties of multi-layer PCBs and the inside of most types of passive or active electrical components as well as smaller structures.



- Low vacuum Scanning Electron Microscope
- Energy Dispersive X-ray Fluorescence spectroscopy
- Real time X-ray microscope
- Differential Scanning Calorimetry
- Fourier Transform Infrared Spectroscopy
- Thermal Mechanical Analysis
- De-capsulation system
- Single event effect testing
- Seal test, fine and gross leak equipment
- Particle Impact Noise Detection testing (PIND)
- Wet chemical etching
- Single event effect latch-up protection & detection modules
- High resolution optical microscopes with photo facilities
- Exact measurement of currents from 1nA to 10A
- Micromanipulation components
- Liquid crystal microscopy
- Thermal camera filming
- Semi-automatic component grinding & polishing equipment
- Thermal Gravimetric Analysis



Interferometric measurements
- Pointing Performance Testing at Cryogenic Environment
- Full 6 DoF Displacement Measurement
- Accuracy -> 1nm
- Resolution -> 1pm
- Down to 15K
- Inside Liquid Helium Cooled Cryostat
- Operation under high vacuum

Mechanical & Structural Testing.

Beyond Gravity has a long-standing history in the management and execution of mechanical and structural testing. The extensive experience and expertise gained over many years of testing internal projects, combined with the specialized testing equipment developed during this time, ensures that a reliable partner is also available to external customers for all testing services.

Separation Tests
Discover excellence at our Structural Test Center, specialized in precision separation tests, including pyrotechnic separation. Granted with a license from the Federal Government our advanced capabilities ensure accurate simulation of different operating conditions for optimal insights, covering time-critical measurements as well as high-speed camera recordings.

Static Load Testing
Different test rigs in different sizes are available for large scale structural testing under static load. The 10-meter static load test rig is the largest test rig for spaceflight structures in frame design in Europe. Structures up to 10 meters in height and 6 meters in diameter can be tested with axial and lateral loads of 2'200 kN and bending moments of 6'600 kNm.

All of the test rigs are modular in their assembly and, thus, can be adapted to any structure being tested. Through the use of hydraulic control systems, it is possible to apply axial and lateral loads as well as bending moments, while the data are collected with up to 1085 channels data acquisition systems.

Specifications of test equipment
- Load cells to monitor and control the load application
- Hydraulic actuators up to 500 kN
- Independent reference frames on which displacement transducers can be mounted
- Computer controlled hydraulic benches
- Independent hydraulic pressure monitoring system
- The test item can be equipped to monitor its behavior in real time during the test with:
- Heater blankets
- Load cells
- Strain gauges
- Displacement transducers
- Pressure transducers
- Thermocouples
- Angular inclination Sensors

Static Load Test Rig

Facility	Working Area	Max. Axial Loads	Max. Lateral Loads	Max. Bending Moment	Hydraulic Control System	Overhead Cranes	Data Acquisition
Large Static Load Test Rig	10 × 10 × 13 m	2'200 kN	1'600 kN	6'600 kNm	32 Channels	6.3 T and 10 T at heights of 6.5 m and 12 m	max. 1'085 channels
Static Load Test Rig	6 × 6 × 6 m	1'200 kN	500 kN	-	32 Channels	6.3 T at height of 6 m	max. 1'085 channels
Static Load Test Rig	3,5 x 3,5 x 5 m	1'477 kN	960 kN		11 Channels	10 T at height of 8,5 m	max. 464 channels
Static Load Test Rig	2 x 2 x 3 m	945 kN	960 kN		11 Channels	10 T at height of 8,5 m	max. 464 channels

Separation Test
Beyond Gravity stands as a premier entity in executing a wide spectrum of separation tests. The team showcases an exceptional ability to measure the forces and motions with precision that emerge during these tests. A number of our testing engineers hold licenses to handle pyrotechnic devices. These operations have received authorization from the State Secretariat for Education, Research, and Innovation of Switzerland.

We employ a variety of tools such as laser rackers, strain gauges, accelerometers, thermocouples, and high-speed cameras, coupled with cutting-edge tracking software. These tools allow us to measure, identify, and record the forces and movements involved in the tests.

We offer the following separation tests:
- Pyrotechnical Separation test
- Mechanically spring-loaded separation test
- Gas spring loaded separation test
- Explosive bolts separation test

Separation Mechanisms:
- CBOD (Clamp Band Opening Device)
- PIN-puller test
- Separation nut test

Modal Survey – Structural Dynamic Characterization of Components.

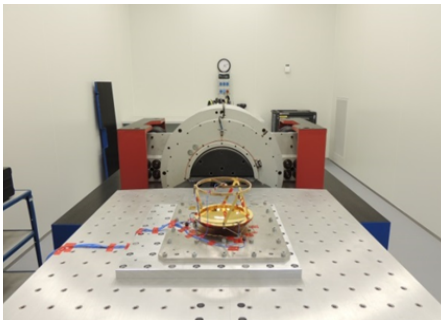
Investigate the structure dynamic response of your product to verify and optimize your design – with Beyond Gravity modal survey solutions.

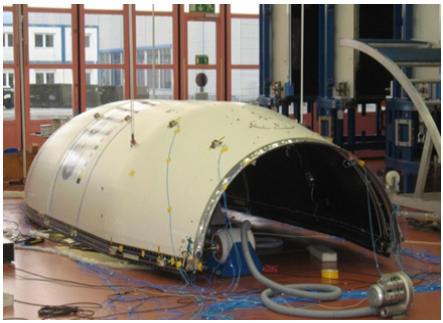
Beyond Gravity performs modal testing services for several industrial applications:

- To understand the dynamic behavior of structures by physically testing and measuring fundamental mode shapes, damping and frequencies.
- To understand the root cause of noise and vibration problems.
- For diagnostics and health monitoring to confirm product quality from the production line and in the field.

Our Services

Beyond Gravity uses industry-leading software and hardware for all phases of modal survey and operational modal analysis.
Our engineers perform pre-test analysis, create modal survey test plans, supply all test equipment for data acquisition, and perform data reduction for mode shape extraction.





Specification of Test Equipment

- Calibrated modal hammers up to 2’000 N force and DC - 6’000 Hz bandwidth
- Modal shakers up to 450 N force, sine and random excitation
- Modal accelerometers and acquisition system for dynamic measurements
- Rigid test rigs for fixed boundary conditions
- Electro-dynamic shakers up to 180 kN force and 2’000 Hz bandwidth for operational modal analysis
- High speed data aquistion 100+ channels

Environmental Testing.

The Beyond Gravity Test Centers specialize in the performance of mechanical and climatic environmental testing. Not only the execution of development and qualification tests is an essential part of our expertise, but also the consulting, organization, coordination and management of test programs in internal and external facilities on behalf of our customers.

Vibration and Shock Testing
The Beyond Gravity Test Centers are equipped with electro-dynamic shakers, facilitating the testing of various test articles of diverse sizes and weights along both horizontal and vertical axes. The application of the latest control and measurement techniques ensures precise testing and comprehensive data acquisition.

A wide array of adapters and angle support structures are available for all the shakers, accommodating a multitude of test configurations. It's worth noting that one of our vibration test equipment is specially installed in a clean room environment.

The strongest shaker in Switzerland
With 178 kN vibration- and 534 kN shock force, the Unholtz-Dickie T4000 is the strongest shaker in Switzerland. The pneumatic auto-centering system allows for the testing of loads as heavy as 1800 kg along the vertical axis. Even more in the horizontal axis.

Unholtz-Dickie T4000

The LDS V964 Shaker is capable to test articles up to 900 kg with the maximum sine force of 89 kN. The shaker is located in a clean-room environment, which can be equipped with a particle measurement system on request.

For the LDS V850 shaker a thermal chamber is available, enabling testing in the temperature range of -60 °C to +100 °C. The LDS V850 is designed for the vibration testing of medium-sized payloads up to 350 kg with a maximum sine force of 22 kN inside as well as outside of the thermal chamber.

The Tira TVS51120 our smallest shaker is capable to test components and smaller test articles up to 3 kg. The shaker is located in a clean-room environment and offer testing in the range 2 – 7'000Hz.

Shock Testing
With our MTS Shock machine, it is possible to conduct half-sine shock tests under more extreme conditions than the shakers are capable of. Loads of up to 150 kg can be tested horizontally and vertically with an acceleration of up to 2'000 g* and pulse duration between 50 and 0.25 ms. The maximum table size is 69 × 65 cm.

Pyroshock Testing
Pyroshock refers to the reaction of a structure when subjected to mechanical stimulation of high frequency and large amplitude. The response frequencies can escalate up to 20 kHz, comprising the resonant frequencies of the test sample. The maximum acceleration can exceed 10,000 g. Additionally, we provide pyroshock testing services in a clean room setting.

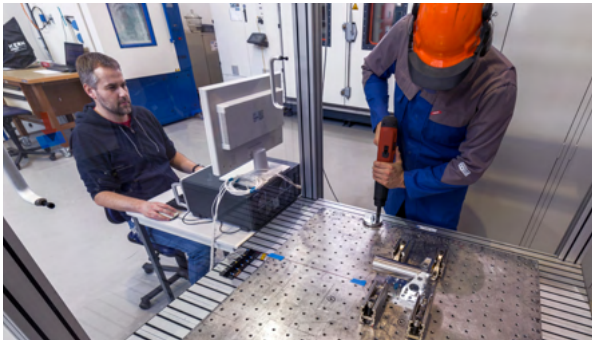
The Beyond Gravity Test Centers are well-equipped to conduct pyroshock tests on mechanisms across a wide range of frequencies and amplitudes.

Shock Machine MTS

Acceleration	2 – 2'000 g*
Pulse Duration	50 to 0.25 ms*
Max. Load	150 kg*
Orientation	Horizontal & vertical
Table size	69 cm × 65 cm

Pyroshock

Acceleration	> 10´000 g*
Type of excitation	Pyrogun, fall tower pendullum, linear guided hammer, pneumatic actuator
Max. Load	50 kg*
Orientation	Up to 3 axes
Max. test item size	600 mm × 600 mm*



* Maximum values may depend on the specifications of the test and may vary.

Centrifuge Testing
The Beyond Gravity Test Center in Switzerland is equipped with a large-scale centrifuge that allows test specimens weighing up to 30 kg and measuring 50 × 50 × 50 cm to be tested with very high g-forces. The acceleration can reach up to 80 g.

Centrifuge	
Acceleration	4 – 80 g*
Max. Load	30 kg*
Orientation	Up to 3 axes
Max. test item size	50 x 50 x 50 cm

* Maximum values may depend on the specifications of the test and may vary.

Climatic Testing
The Beyond Gravity Test Centers are equipped with various climatic test chambers, temperature chambers, thermal shock chambers and altitude chambers allowing to regulate humidity from 10% RH up to 98% RH and temperature between a minimum -75 °C up to a maximum of +300 °C.

Our largest climatic chamber provides a spacious interior that can accommodate dimensions of 2,000 x 2,000 x 1,350 mm. Additionally, we have a temperature chamber that is compatible with the LDS V850 shaker, enabling us to conduct vibration tests under specific temperature conditions ranging from -60 to +100 °C. This allows for comprehensive testing under various environmental conditions.

Our temperature shock chambers are able to generate thermal shocks in the temperature range from -190 °C to +200 °C. With an altitude chamber, it is possible to simulate altitudes up to 30,000 meters (down to 4 mbar).

Thermal Vacuum Testing

Testing in a thermal vacuum chamber is an essential part of testing equipment for use in space to predict behavior in space-like conditions.

Our vacuum chambers can be equipped with various electrical feed through for connecting the test specimen during test to ensure the correct functioning and to monitor the behavior of the test object.

Vacuum Chamber	Maximum Test Dimensions	Temperature Range	Remarks
TVC L1	600 x 600 x 600 mm	-185 °C to +185 °C

EMC Tests

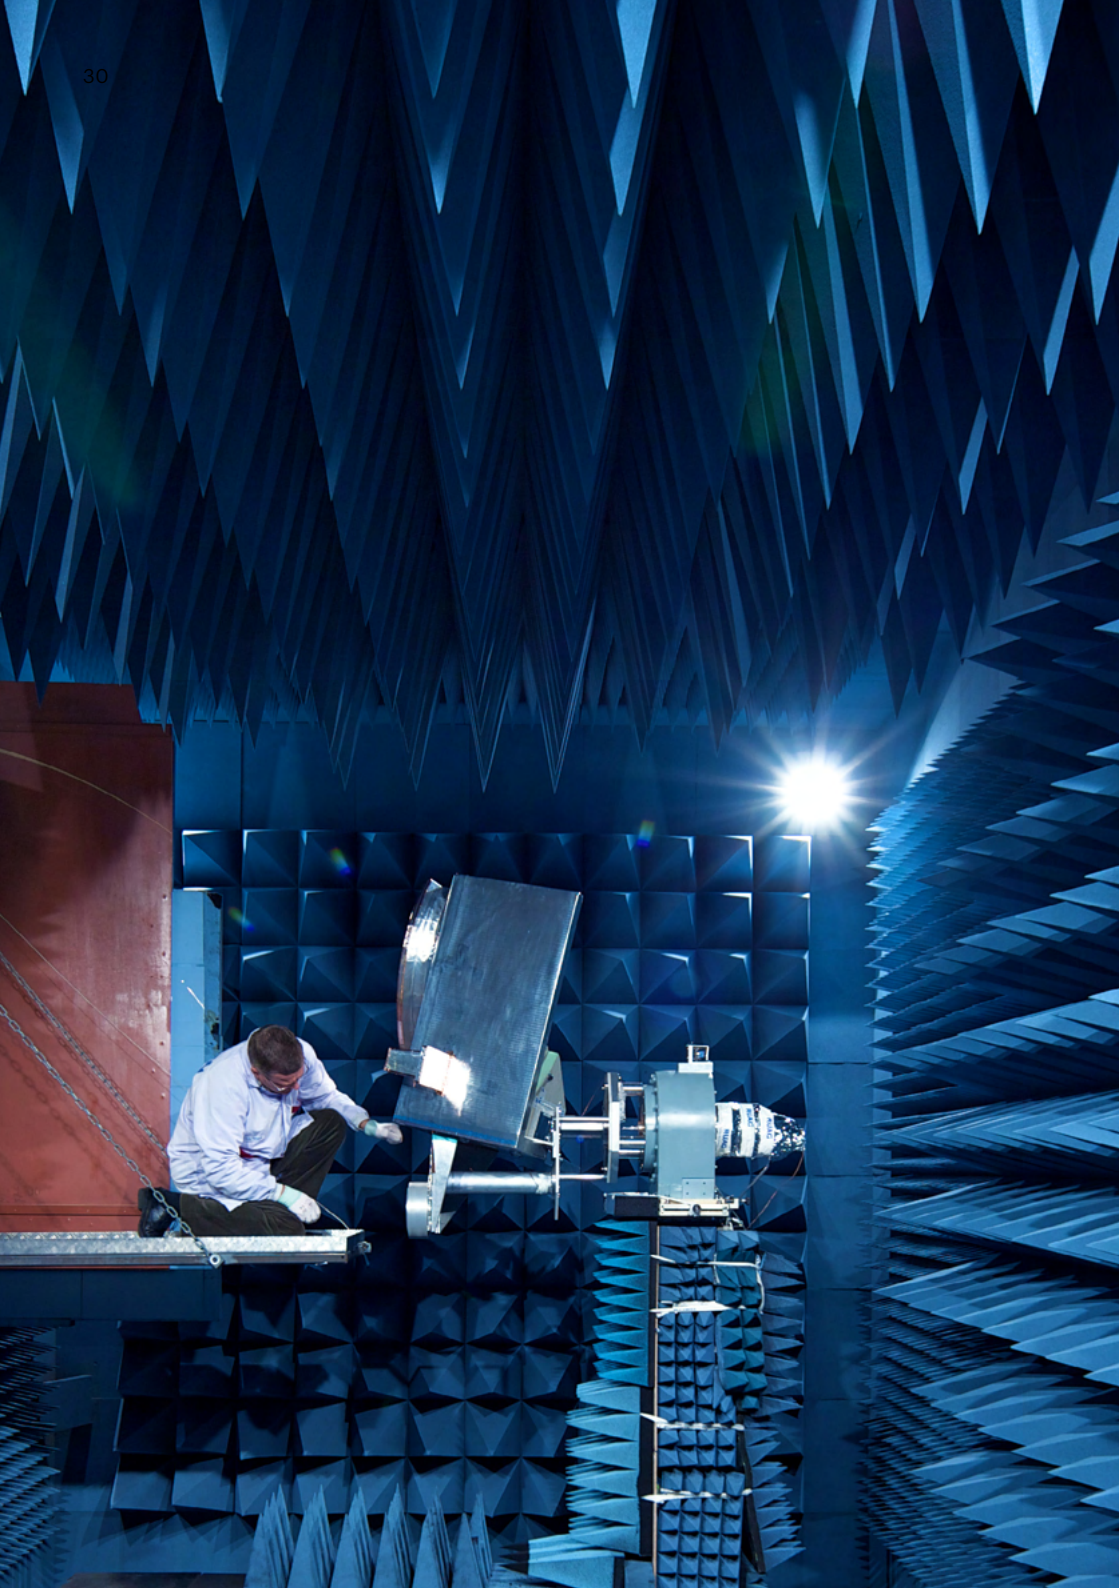
Beyond Gravity can provide EMC testing in shielded chambers at multiple locations and has the capability to perform reverberation measurements as well.

EMC Tests	
Conducted Emission	30 Hz – 1'000 Hz
Conducted Susceptibility	30 Hz – 1'000 Hz
Radiated Emission and Susceptibility	H-Field
Reverb Measurements	40 Hz – 40 GHz
ESD Contact	Up to 30 kV
ESD Air	Up to 30 kV
ESD Contact	Up to 30 kV
Other	Selected transient tests

Antenna Testing

Beyond Gravity offers antenna testing in its own RF lab and 6-meter antenna measurement range. We can perform near and far field measurements from 900MHz up to 40 GHz. The test facilities are set up with the latest available test equipment and has automatic roll tables for fast and accurate measurements.

Antenna Testing	
Telemetry and Telecommand Antennas	S-band, C-band, X-band, Ku-band, Ka-band
Link Antennas	L-band, S-band, K-band, X-band, Ka-band
Global Navigation Satellite System Antennas	GNSS RX, GNSS TX, Satellite Based Augmentation, System Antennas
Earth Observation Antennas	Scatterometer, C-band Radio Occultation, L-band
User Antennas	S and L-band Patch Excited Cup Array Elementys
	Feed Array
	X-band SAR and Intersatellite link Antennas
	Custom made Antennas....



Space Mechanism Testing
Beyond Gravity has developed its own methods of tracking and evaluating mechanical movements.

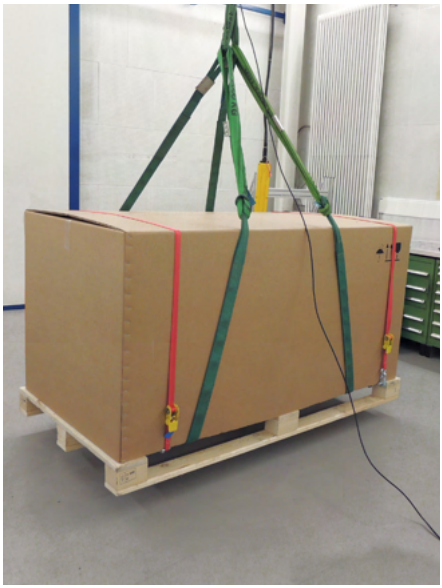
EGSE Development
- Function & Performance Testing
- High Level Test Automation
- TV Test Control
- Calibrated Data Acquisition

Photogrammetry – Motion Tracking
- Mono camera system, measurement of rotation of mechanism
- Accuracy 0.02°, Resolution 0.005°(Mono)
- Multi camera system, Measurements of 6 DoF mechanisms
- Accuracy 50m/0.02°, Resolution 10m/0.005°(Multi)

Planetary Surface Simulation
As the only company in Europe, equivalent Lunar and Martian soil test beds are available. Beyond Gravity offers testing and verification of wheels and locomotion including deployment and egress. The test bed can be adapted to simulate the real surface conditions. High-speed cameras, accelerometers and potentiometers, visualization and processing tool are used to record and document the results. The test bed can also be used bulk density measurements. Packing density determines much of the behavior and can be used to simulate other influences on behavior for example influence of ageing.

Planetary Surface Test Bed

Size	6 x 6 Meters
Tilting	Tiltable up to 30 Degrees
Surfaces	4 types of dust/sand to simulate the surface and landscape on the Moon and Mars
Observation/Documentation	• High speed film • Synchronized video • Recording of up to 30 analog signals • Real time tracking



Drop Test
As a part of environmental testing, we can also perform drop tests. These tests are used to simulate typical handling errors in the loading and unloading process of cargo. For drop tests with large test samples, an overhead crane mounted to the ceiling is used. With this crane the drop height can be set up to 3 meters. We can perform drop tests on following surfaces: Concrete, sand, gravel and wood. For safety reason the drop test is released remote controlled.

Highspeed Imaging
With up to 1´000 frames per seconds (up to 100´000 with reduced resolution), we are capable to record high dynamic processes. The newest tracking software and up to 8 synchronized simultaneous recording cameras can track and measure objects in 3 dimensions.

Precision on earth. Reliability in space.

Beyond Gravity (formerly known as RUAG Space), headquartered in Zurich (Switzerland) and part of the aerospace group RUAG International, is the first space company to combine a start-up mindset, agility, speed and innovation with decades of experience and proven quality.

Our vision: Number one independent space product supplier
Around 1,800 employees at 14 locations in seven countries (Switzerland, Sweden, Austria, Germany, USA, Finland and Portugal) develop and manufacture products for satellites and launch vehicles with the goal of advancing humankind and enabling the exploration of the world and beyond. Beyond Gravity is the preferred supplier of structures for all types of launch vehicles and a leader in selected satellite products and for constellations in the New Space sector. We have been involved in space missions ever since the first endeavors – and we have always overcome the boundaries. The boundaries of our innovative home country, the boundaries between European and American partners, the boundaries of our atmosphere, the boundaries of what is technically possible.

Pushing boundaries to realize what's next
Our customers can rely on us to turn their mission into a success. Anyone who flies customers into orbit and sets their sights beyond the horizon needs to be passionate, curious and have the will to innovate in order to meet the challenges that new worlds present. At the same time, we are not daredevils, but have a down-to earth attitude. A contradiction? No: because reliability, meticulous planning and a rigorous testing regime are mission critical.
Beyond Gravity has delivered products for hundreds of different missions in over 40 years. We are currently working on around 400 projects. What they all have in common? They all ultimately serve an important purpose that advances humankind. Our activities encompass weather forecasting, satellite-based positioning and communications in even the most remote corners of the globe, satellite data to manage natural hazards, new discoveries revealing the mysteries of our universe, scientific experiments in space and exciting new developments like self-driving cars – everything depends on space technology. With endless opportunities, we help our customers around the world make the impossible possible.
